                                                                                    into a host animal, in conjugation with eg keyhole limpet haemocyanin, and the B-cells from immunised hosts are then fused with myeloma cells. The resultant hybridomas (VAA-8 and VAA-9) produce Abs specific to VAC-alpha. Abs can be used as immunoassay reagents to detect VAC proteins, affinity ligands for protein purificm. and as medicaments for binding and/or neutralising VAC proteins in vivo. ```

This sequence represents an example of a protein of the invention. The proteins are bifunctional Aequorea victoria green fluorescent protein (GFP)-annexin fusion proteins, where the GFP and annexin moieties proteins are useful fluorescent intensity and anionic phospholipid bindir greater or equal fluorescent intensity and anionic phospholipid bindir of affinity, respectively, than do the corresponding unfused GFP and annexin of proteins. An early manifestation of apoptosis is the loss of the companies of the co

Claim 2; Page 14-15; 23pp; English.

The domain of annexin, which may be modified, is used to construct the chemical compounds of the invention. The specification describes chemical compounds which have an affinity for a phospholipid. The chemical compounds comprise at least one chemical platform comprising six residues supporting a set of chemical functions that are capable of binding to the supporting and at least partly define the affinity of the structure for phospholipid and at least partly define the affinity of the structure for the phospholipid. The compounds act as phospholipid sequesters. The compounds are useful for preparing antithrombotic, antitumor and antiinflammatory medicaments, for making coatings for thrombogenic biomaterials, and for preparing labelling compounds useful for analysing and detecting negative charges on cell surfaces and microvesicles in the compounds are useful for analysing between the compounds useful for analysing biomaterials, and for preparing labelling compounds useful for analysing biomaterials.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 320

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   turn appears due to binding of the activated isozymes to the specific anchoring molecules (RACKs). Peptides that mimic either the PKC-binding site on RACKs or the RACK-binding site on PKC are isozyme specific translocation inhibitors of PKC. The disclosed peptides are useful in activating or inhibitors of PKC. The disclosed peptides are useful in deltaPKC agonists or antagonists are useful in reducing, enhancing or protecting against damage to cells or tissues due to ischaemic or hypoxic event caused by stroke. Acute administration of the peptides, conjugated to a carrier peptide or a Tat-derived peptide, protected hearts against data indicate that in an intact heart, inhibition of deltaPKC conferred greater than 50% protection against ischaemic damage. The sequence presented is human annexin V, which contains a delta RACK binding site
                                                                                                                        AAP90053 standard; protein;

                                                                                                                                                                                                                                                                                                                                                                                                                                                        Annexin V, which has high affinity for active thrombocytes, is used as a carrier molecule to build a thrombus-targeting thrombolytic fusion protein. The protein (this sequence) is the result of expression of a fusion gene comprising the Annexin V gene and a low-molecular urokinase gene, in insect cells. The Annexin V-scu-PA-32 fusion protein, expressed in insect cell strain Tn-5B1-4, has high affinity for active thrombocytes and has the fibrinolytic activity of urokinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Unidentified.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The protein does not contain a leader peptide sequence, indicating that PAP-I is probably not constitutively secreted. The Met residue is removed at in a post-translational event and the newly formed NH2-terminal Ala residue is blocked by acetylation. It binds to phospholipid and inhibits phopholipase A2. The protein can substitute heparin or other anticoagulants in the treatment of disseminated intravascular coagulation, deep vein thrombosis, or other disorders. It also has antiinflammatory properties. (Updated on 25-MAR-2003 to correct PA field)

                                                                                                                                                                                                                                                                                                                                                                     The sequence given is the amino acid sequence of CPB-I. CPB-I was used within a method which involved adding basic amino acids to it which resulted in its stabilisation. This lead to the production of CPB-I which keeps its activity when it is frozen, molten or has been processed by several procedures. (Updated on 10-MAR-2003 to add missing OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Stabilisation of CPB-I for drug compsn. - by adding selected from lysine, arginine and/or ornithine.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Homo sapiens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to eye drops contain CPB-I (anexin V) and a polyhydric alcohol having a carbonyl value of not more than Smicro Mol./g. The eyes drops are for treating e.g. conneal diseases. Such ey drops are without unpleasant irritation upon dropping but with satisfactory long-term storage stability. The present sequence is the human CPB-I (calcium/phospholipid binding) protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Eye drops for treating e.g. corneal diseases, contain CPB-I and polyhydric alcohol with specific carbonyl value, without umpleasant irritation upon dropping but with satisfactory long-term storability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         26-FEB-2001; 2001JP-00050297

CC derivative or allelic variation of the mucleic acid sequence. Also comprising the vector comprising the novel polynucleotide, a host cell claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal compound that regulates the expression of the polynucleotide sequence the expression of a polynucleotide sequence which is differentially expressed in neuronal tissue of a first animal compound that regulates the activity of one or more of the polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound which regulates the compound that regulates the activity of one or more of the polynucleotides given in the polynucleotides or identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more completed that regulates the compound that regulates the its activity is useful for preparing a medicament for treating pain and a pharmaceutical composition comprising the one or more completed that polypeptides or their antibodies. The polynucleotide or the compound that compound that polypeptides or their antibodies. The polynucleotide or the compound that compound provides that polypeptides or the provide that polypeptides or the provide that polypeptides or the provide that compound that compound that polypeptides or the provide that polypeptides or the compound that polypeptides or the provide that polypeptides or the compound that compound that polypeptides or the provide that polypeptides or the provide that polypeptides or the provide that polypeptides or the provide that polypeptides or the provide that polypeptides or the provide that polypeptides or t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung.

                                                                                                                                                                                                                                                                      Vascular anticoagulating protein (VAP) VAC-alpha; anticoagulant activantiinflammatory; phospholipase inhibitory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     polypeptides or their antibodies. The polynucleotide or the compound modulates its activity is useful for preparing a medicament for treat pain (e.g. spinal segmental nerve injury (Chung), chronic constrictingly: (CCI) and spared nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a human protein (shown in Table the specification) which is differentially expressed during pain. No The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIP

VAC-alpha has anticoagulant activity under certain conditions, but loses this activity in the event of severe bleeding. It acts by inhibiting conversion of factor X to factor Xa and conversion of prothrombin to thrombin. It is structurally related to 1pocortin I (Nature, 320, 77, 1986) and lipocortin II (Cell, 46, 191/120, 1986) and has similar antiinflammatory and phospholipase inhibitory activity. (Updated on 25-MAR-2003 to Covert in first).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Peptide
The DNA is produced by determining the amino acid sequence of isolated and highly purified VAPs, constructing DNA probes on the basis of this sequence, using the probes to search through suitable cDNA libraries, isolating cDNA that hybridises with the probes, by inserting the cDNA into a suitable vector, and using the vector to transform a host organism. The posn. of the AA sequences used to construct the probes are given in FT. VAC-alpha has anticoagulant activity under certain conditions, but loses this activity in the event of severe bleeding. It acts by inhibiting conversion of factor X to factor Xa and conversion of prothrombin to thrombin. It is structurally related to lipocortin I prothrombin to thrombin and lipocortin I (Cell, 46, 191/120, 1986) and has similar antiinflammatory and phospholipase inhibitory activity. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Peptide

```

(VAC) comprises an

annexin.

ij

The sequence given is the amino acid sequence of CPB-1. CPB-1 was used within the method of the invention which involved adding saccharides t

The saccharide was pref. glucost glucosamine, xylose, saccharose or dextran. This lead to the production of CPB-I which kept its activity when it had been processed by several treatments. CPB-I can be used as a medicine for antihemagglutination, dermal and corneal diseases. (Updated on 10-MAR-2003 to add missing OS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is a modified annexin having an N-terminal chelation site, which comprises an amino acid extension including a glycine and a cysteine residue. The modified annexin is useful for imaging vascular thrombi or apoptosis which is associated with response to a thrombi or apoptosis which is associated with response to a chemotherapeutic agent or with rejection as a result of transplantation. The modified annexin can effectively chelate a radionuclide and retain annexin bioactivity. It can be readily prepared in high radiochemical yield and with high radiochemical purity. In contrast to conventional conjugation chemistries that provide a distribution of conjugation products, the modified annexin has a single chelation site remote from the site of biological activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 327 AA;

                                                                                                                                                                                                                                                                 AAB50863 standard; protein; 327
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              thrombi or apoptosis which is associated with response to a chemotherapeutic agent or with rejection as a result of transplantation. The modified annexin can effectively chelate a radionuclide and retain annexin bioactivity. It can be readily prepared in high radiochemical yield and with high radiochemical purity. In contrast to conventional conjugation chemistries that provide a distribution of conjugation products, the modified annexin has a single chelation site remote from the site of biological activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 327
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is a modified annexin having an N-terminal chelation site, which comprises an amino acid extension including a glycine and a cysteine residue. The modified annexin is useful for imaging vascular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 18; Page 37-38; 39pp; English
